

App Store Analysis - SQL

1. **Project Context** – Dataset that covers information about apps available on the Apple store (Kaggle.com), Info includes apps' name, ratings, # of languages support, description etc.
2. **Connect to the dataset** - Using SQLiteonline.com
3. **Identify the stakeholder** – An app developer who needs data driven insights to decide what type of app to build. Questions:
 - What app categories are more popular?
 - Should it be paid or free?
 - How to maximize user ratings?
4. **Exploratory data analysis EDA** – Using SQL, identify missing or inconsistent data, errors or outliers. Also, find patterns & insights from the dataset.
5. **Finding the insights**
 - Paid vs free apps have better ratings
 - Apps supporting between 10 and 30 languages have better ratings
 - Finance and Book apps have low ratings
 - Apps with a longer description have better ratings
 - Average ratings are around 3.5
 - Games and entertainment category have high competition
6. **Final recommendations**
 - Paid vs free apps have better ratings (higher engagement & perceive more value) so consider charging certain amount for the app
 - Apps supporting between 10 and 30 languages have better ratings. It's not only about the number of languages the app support but focusing on the right languages based on the region they are targeting.
 - People are less satisfied with existing finance and book apps; this suggests the user needs are not fully met. So, this can represent a market of opportunity, because if they can create a quality app in these categories that addresses user's needs better than the current offering there is potential for high user ratings and market penetration
 - The length of the description has a positive correlation with the user ratings so users likely appreciate having a clear understanding of the apps' features and capabilities before they download the app. A detailed well-crafted app description can set clear expectation and eventually increase the satisfaction of users
 - A new app should aim for an average rating above 3.5. On average all the apps have a rating of around 3.5 so in order to stand out from the crowd, they should aim for a rating that is higher than the average
 - Games and entertainment category have high volume of apps suggesting the market may be saturated so entering these spaces might be challenging with high competition, however it also suggests a high demand in these sectors
